FIELD OF THE INVENTION

BACKGROUND OF THE INVENTION

A retrovirus designated human immunodeficiency virus (HIV) is
the etiological agent of the complex disease that includes progressive destruction
of the immune system (acquired immune deficiency syndrome; AIDS) and
degeneration of the central and peripheral nervous system. This virus was
previously known as LAV, HTLV-III, or ARV. A common feature of retrovirus
replication is the insertion by virally-encoded integrase of proviral DNA into the
host cell genome, a required step in HIV replication in human T-lymphoid and
monocytoid cells. Integration is believed to be mediated by integrase in three
steps: assembly of a stable nucleoprotein complex with viral DNA sequences;
cleavage of two nucleotides from the 3' termini of the linear proviral DNA;
covalent joining of the recessed 3' OH termini of the proviral DNA at a staggered
cut made at the host target site. The fourth step in the process, repair synthesis of
the resultant gap, may be accomplished by cellular enzymes.

Nucleotide sequencing of HIV shows the presence of a pol gene in
one open reading frame [Ratner, L. et al., Nature, 313, 277(1985)]. Amino acid
sequence homology provides evidence that the pol sequence encodes reverse
transcriptase, integrase and an HIV protease [Toh, H. et al., EMBO J. 4, 1267
(1985); Power, M.D. et al., Science, 231, 1567 (1986); Pearl, L.H. et al., Nature,

329, 351 (1987)]. All three enzymes have been shown to be essential for the replication of HIV.

It is known that some antiviral compounds which act as inhibitors of HIV replication are effective agents in the treatment of AIDS and similar diseases, e.g., azidothymidine or AZT. Applicants demonstrate that the compounds of this invention are inhibitors of HIV integrase and inhibitors of HIV replication. The applicants additionally demonstrate that inhibition of integrase in vitro and HIV replication in cells is a direct result of inhibiting the strand transfer reaction catalyzed by the recombinant integrase in vitro in HIV infected cells. The particular advantage of the present invention is highly specific inhibition of HIV integrase and HIV replication. The compounds of the present invention inhibit integrases of closely related lentiviruses such as HIV 2 and SIV, but not integrases from more distantly related retroviruses, for example RSV. These compounds do not inhibit binding or catalysis of other nucleic acid binding proteins, including enzymatic reactions such as those catalyzed by HIV reverse transcriptase, HIV Rnase H, Influenza transcriptase, Hepatitis C polymerase, Yeast DNA polymerase, DNase I, Eco RI endonuclease, or mammalian polymerase II.

Zhao et al. (J. Med Chem., vol. 40, pp. 937-941 and 1186-1194 (1997)) describe hydrazide and arylamide HIV integrase inhibitors. LaFemina et al. (Antimicrobial Agents & Chemotherapy, vol. 39, no. 2, pp. 320-324, February 1995) describe bis-catechols useful for inhibiting HIV integrase. Lin et al. (J. Med. Chem., vol. 42, pp. 1401-1414 (1999)) describe chicoric acid analogues as HIV-1 integrase inhibitors.

US 4937370 discloses certain 1,3-diaryl-1,3-propanediones and their use as sunscreen agents.

At the National Institutes of Health AIDS Structural Biology Meeting held June 9-11, 1999 at the Lister Hill Auditorium, David R. Davies disclosed 1-(5-chloroindol-3-yl)-3-(5-tetrazolyl)-1,3-propanedione as an integrase inhibitor. 1-(5-Chloroindol-3-yl)-3-(5-tetrazolyl)-1,3-propanedione is also disclosed in Goldgur et al., *Proc. Nat'l Acad. Sci. U.S.A.* 1999, vol. 96, pp. 13040-13043. A related document is WO 99/50245 (Fujishita et al.) which discloses the preparation of indole derivatives with antiviral activity.

or a pharmaceutically acceptable salt thereof.

Many known active inhibitors of viral integrase (e.g., bis-catechols and

In contrast, the compounds of the present invention, in addition to being potent HIV integrase inhibitors, are sufficiently nonpolar to freely permeate cells where they exhibit potent antiviral activity. More particularly, the compounds of the present invention typically have a value of log P (defined below)
 25 greater than 0.

The present invention also includes pharmaceutical compositions containing a compound of the present invention and methods of preparing such pharmaceutical compositions. The present invention further includes methods of treating AIDS, methods of preventing infection by HIV, and methods of treating
 30 infection by HIV.

These and other embodiments, aspects and features of the present invention are either further described in or will be apparent from the ensuing description, examples, and appended claims.

The term "fluorinated C₁-C₆ alkyl" (which may alternatively be referred to as "C₁-C₆ fluoroalkyl") means a C₁ to C₆ linear or branched alkyl group as defined above with one or more fluorine substituents. The term "fluorinated C₁-C₄ alkyl" has an analogous meaning. Representative examples of suitable fluoroalkyls
15 include the series (CH₂)₀₋₄CF₃ (i.e., trifluoromethyl, 2,2,2-trifluoroethyl, 3,3,3-trifluoro-n-propyl, etc.), 1-fluoroethyl, 2-fluoroethyl, 2,2-difluoroethyl, 3,3,3-trifluoroisopropyl, 1,1,1,3,3,3-hexafluoroisopropyl, and perfluorohexyl.

The term "fluorinated C₁-C₆ alkoxy" (which may alternatively be referred to as "C₁-C₆ fluoroalkoxy") means a C₁-C₆ alkoxy group as defined above
20 wherein the alkyl moiety has one or more fluorine substituents. The term "fluorinated C₁-C₄ alkoxy" has an analogous meaning. Representative examples include the series O(CH₂)₀₋₄CF₃ (i.e., trifluoromethoxy, 2,2,2-trifluoroethoxy, 3,3,3-trifluoro-n-propoxy, etc.), 1,1,1,3,3,3-hexafluoroisopropoxy, and so forth.

The term "fluorinated C₂-C₈ alkoxyalkyl" means C₂-C₈ alkoxyalkyl
25 as defined above, wherein either or both the alkoxy moiety and the alkyl moiety has one or more fluorine substituents. Representative examples of suitable fluorinated alkoxyalkyl groups include, but are not limited to, the C₁-C₆ fluoroalkoxy-substituted methyl groups (e.g., fluoromethoxymethyl, 2-fluoroethoxymethyl, and 3-fluoro-n-propoxymethyl), C₁-C₆ difluoroalkoxymethyl groups (e.g., difluoromethoxymethyl

Other suitable fluorinated alkoxyalkyl groups include the series (CH₂)₁₋₆OCF₃,

$(\text{CH}_2)_{1-4}\text{OCF}_3$, $(\text{CH}_2)_{1-3}\text{OCF}_3$, $(\text{CH}_2)_{1-6}\text{OCH}_2\text{CF}_3$, $(\text{CH}_2)_{1-4}\text{OCH}_2\text{CF}_3$, and $(\text{CH}_2)_{1-3}\text{OCH}_2\text{CF}_3$.

The term "carbocycle" (which may alternatively be referred to herein as "carbocyclic") as used herein broadly refers to a C₃ to C₈ monocyclic, saturated or unsaturated ring or a C₇ to C₁₀ bicyclic ring system in which each ring is saturated or unsaturated. The carbocycle may be attached at any carbon atom which results in a stable compound. The fused bicyclic carbocycles are a subset of the carbocycles; i.e., the term "fused bicyclic carbocycle" generally refers to a C₇ to C₁₀ bicyclic ring system in which each ring is saturated or unsaturated and two adjacent carbon atoms are shared by each of the rings in the ring system. A subset of the fused bicyclic carbocycles are the fused bicyclic carbocycles in which one ring is a benzene ring and the other ring is saturated or unsaturated, with attachment via any carbon atom that results in a stable compound. Representative examples of this subset include the following:

The term "heterocycle" (which may alternatively be referred to as "heterocyclic") broadly refers to a 5- to 7-membered monocyclic ring or 7- to 10-membered bicyclic ring system any ring of which is saturated or unsaturated, and which consists of carbon atoms and one or more heteroatoms selected from N, O and S, and wherein the nitrogen and sulfur heteroatoms may optionally be oxidized, and the nitrogen heteroatom may optionally be quaternized. The heterocyclic ring may be attached at any heteroatom or carbon atom, provided that attachment results in the creation of a stable structure. Representative examples of heterocyclics include piperidinyl, piperazinyl, azepinyl, pyrrolyl, pyrrolidinyl, pyrazolyl, pyrazolidinyl, imidazolyl, imidazolidinyl, imidazoliny, pyridyl, pyrazinyl, pyrimidinyl, pyridazinyl, oxazolyl, oxazolidinyl, isoxazolyl, isoxazolidinyl, morpholinyl, thiazolyl, thiazolidinyl, isothiazolyl, quinoxazoliny, isothiazolidinyl, quinolinyl, isoquinolinyl,

- benzimidazolyl, thiadazolyl, benzopyranyl, benzothiazolyl, benzoazolyl, furyl, tetrahydrofuryl, tetrahydropuranyl, thienyl (also referred to as thiophenyl), benzothiophenyl, and oxadiazolyl. Representative examples of heterocyclics also include tetrahydrothienyl, tetrahydrodioxothienyl, thiadiazinanyl, dioxothiadiazinanyl, 5 thiazinanyl, dioxothiazinanyl, dioxothiazolidinyl, and isodioxothiazolidinyl.

- Fused ring heterocycles form a subset of the heterocycles as defined above; i.e., the term "fused bicyclic heterocycle" refers to a heteroatom-containing bicyclic ring system as defined in the preceding paragraph in which two adjacent atoms are shared by both rings. A subset of the fused bicyclic heterocycles is the 10 fused bicyclic heterocycle containing carbon atoms and one or more heteroatoms selected from nitrogen, oxygen and sulfur, wherein one ring is a benzene ring and the other is a saturated or unsaturated heteroatom-containing ring. Representative examples of this subset include, but are not limited to, the following:

15

- Heteroaromatics form another subset of the heterocycles as defined above; i.e., the term "heteroaromatic" generally refers to a heterocycle as defined above in which the ring system (whether mono- or bi-cyclic) is an aromatic ring system. The term "heteroaromatic ring" refers to a monocyclic heterocycle as defined 20 above which is an aromatic heterocycle. Representative examples of heteroaromatics include pyridyl, pyrrolyl, pyrazinyl, pyrimidinyl, thienyl (alternatively referred to as thiophenyl), thiazolyl, furanyl, imidazolyl, pyrazolyl, triazolyl, tetrazolyl, oxazolyl, oxadiazolyl, thiazolyl, and thiadiazolyl.

It is important to note that the foregoing definitions of carbocycle, fused bicyclic carbocycle, heterocycle, fused bicyclic heterocycle, heteroaromatic, and heteroaromatic ring are offered as general guidance on the scope of these terms as used herein. Additional restrictions are typically imposed on these terms in the definition of the variables A, B, and R¹ to R⁵ in Formula (I). For example, the carbon number range of a carbocycle may be narrowed, or the type and/or number of heteroatoms in a heterocycle may be more limited, or the point of attachment of the heterocycle may be restricted (e.g., limited to a ring carbon atom), or certain heterocycles may be altogether excluded (e.g., provisos excluding indole from the definition of A and/or B).

The compounds of the invention typically have a value of log P greater than 0. P is the partition coefficient of a molecule in a defined charged state in a biphasic octanol/aqueous system; i.e.,

$$P = \frac{\text{Conc'n of the molecule in octanol}}{\text{Conc'n of the molecule in pH = 7.4 phosphate buffer}}$$

The coefficient is measured at ambient temperature. Log P is the base 10 logarithm of P. Log P is a well-established measure of hydrophobicity and is often indicative of the cell membrane permeability of a compound. Compounds with log P values less than zero (and especially less than -0.5) often have low or no cell permeability, whereas compounds with a log P greater than zero typically can permeate cells freely where they can exhibit potent antiviral activity.

The present invention includes pharmaceutical compositions useful for inhibiting HIV integrase, comprising an effective amount of a compound of this invention, and a pharmaceutically acceptable carrier. Pharmaceutical compositions useful for treating infection by HIV, or for treating AIDS or ARC, are also encompassed by the present invention, as well as a method of inhibiting HIV integrase, and a method of treating infection by HIV, or of treating AIDS or ARC. Additionally, the present invention is directed to a pharmaceutical composition comprising a therapeutically effective amount of a compound of the present invention in combination with a therapeutically effective amount of an AIDS treatment agent selected from:

- (1) an AIDS antiviral agent,
- (2) an anti-infective agent, and

(3) an immunomodulator.

The present invention also includes the use of a compound of the present invention as described above in the preparation of a medicament for (a) inhibiting HIV integrase, (b) preventing or treating infection by HIV, or (c) treating
5 AIDS or ARC.

The present invention further includes the use of any of the HIV integrase inhibiting compounds of the present invention as described above in combination with one or more AIDS treatment agents selected from an AIDS antiviral agent, an anti-infective agent, and an immunomodulator for the manufacture of a
10 medicament for (a) inhibiting HIV integrase, (b) preventing or treating infection by HIV, or (c) treating AIDS or ARC, said medicament comprising an effective amount of the HIV integrase inhibitor compound and an effective amount of the one or more treatment agents.

The compounds of the present invention may have asymmetric centers
15 and may occur, except when specifically noted, as mixtures of stereoisomers or as individual diastereomers, or enantiomers, with all isomeric forms being included in the present invention.

As is recognized by one of ordinary skill in the art, the 1,3-propanedione compounds of the present invention can exist as tautomers, and thus by
20 using the phrase "or a tautomer thereof" in describing a compound of structural formula (I), it is understood that the following tautomeric forms (IA) and (IB) are included in the present invention:

By naming or referring to compound (I) or a tautomer thereof, it is understood for the purposes of the present application that the tautomers (IA) and (IB) are included.

- 5 Similarly, by referring to compound (IA), it is understood for the purposes of the present application that the tautomers (I) and (IB) are included. The same holds true for references to tautomer (IB).

- When any variable (e.g., R^a, R^b, R^c, etc.) occurs more than one time in any constituent or in formula I, its definition on each occurrence is independent of its definition at every other occurrence. Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

The term "substituted" (e.g., as in "substituted phenyl") includes mono- and poly-substitution by a named substituent to the extent such single and multiple substitution is chemically allowed.

- 15 The compounds of the present inventions are useful in the inhibition of HIV integrase, the prevention or treatment of infection by human immunodeficiency virus (HIV) and the treatment of consequent pathological conditions such as AIDS. Treating AIDS or preventing or treating infection by HIV is defined as including, but not limited to, treating a wide range of states of HIV infection: AIDS, ARC (AIDS related complex), both symptomatic and asymptomatic, and actual or potential

exposure to HIV. For example, the compounds of this invention are useful in treating infection by HIV after suspected past exposure to HIV by e.g., blood transfusion, exchange of body fluids, bites, accidental needle stick, or exposure to patient blood during surgery.

5 The compounds of this invention are useful in the preparation and execution of screening assays for antiviral compounds. For example, the compounds of this invention are useful for isolating enzyme mutants, which are excellent screening tools for more powerful antiviral compounds. Furthermore, the compounds of this invention are useful in establishing or determining the
10 binding site of other antivirals to HIV integrase, e.g., by competitive inhibition. Thus the compounds of this invention are commercial products to be sold for these purposes.

 The present invention also provides for the use of a compound of structural formula (I) to make a pharmaceutical composition useful for inhibiting HIV
15 integrase and in the treatment of AIDS or ARC.

 The compounds of the present invention may be administered in the form of pharmaceutically acceptable salts. The term "pharmaceutically acceptable salt" is intended to include all acceptable salts such as acetate, lactobionate, benzenesulfonate, laurate, benzoate, malate, bicarbonate, maleate, bisulfate,
20 mandelate, bitartrate, mesylate, borate, methylbromide, bromide, methylnitrate, calcium edetate, methylsulfate, camsylate, mucate, carbonate, napsylate, chloride, nitrate, clavulanate, N-methylglucamine, citrate, ammonium salt, dihydrochloride, oleate, edetate, oxalate, edisylate, pamoate (embonate), estolate, palmitate, esylate, pantothenate, fumarate, phosphate/diphosphate, gluceptate, polygalacturonate,
25 gluconate, salicylate, glutamate, stearate, glycolylarsanilate, sulfate, hexylresorcinat, subacetate, hydrabamine, succinate, hydrobromide, tannate, hydrochloride, tartrate, hydroxynaphthoate, teoclate, iodide, tosylate, isothionate, triethiodide, lactate, panoate, valerate, and the like which can be used as a dosage form for modifying the solubility or hydrolysis characteristics or can be used in sustained release or pro-drug
30 formulations. Depending on the particular functionality of the compound of the present invention, pharmaceutically acceptable salts of the compounds of this invention include those formed from cations such as sodium, potassium, aluminum, calcium, lithium, magnesium, zinc, and from bases such as ammonia, ethylenediamine, N-methyl-glutamine, lysine, arginine, ornithine, choline, N,N'-
35 dibenzylethylene-diamine, chloroprocaine, diethanolamine, procaine, N-

benzylphenethyl-amine, diethylamine, piperazine, tris(hydroxymethyl)aminomethane, and tetramethylammonium hydroxide. These salts may be prepared by standard procedures, e.g. by reacting a free acid with a suitable organic or inorganic base. Where a basic group is present, such as amino, an acidic salt, i.e. hydrochloride, hydrobromide, acetate, pamoate, and the like, can be used as the dosage form.

Also, in the case of an acid (-COOH) or alcohol group being present, pharmaceutically acceptable esters can be employed, e.g. acetate, maleate, pivaloyloxymethyl, and the like, and those esters known in the art for modifying solubility or hydrolysis characteristics for use as sustained release or prodrug formulations.

For these purposes, the compounds of the present invention may be administered orally, parenterally (including subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion techniques), by inhalation spray, or rectally, in dosage unit formulations containing conventional non-toxic pharmaceutically-acceptable carriers, adjuvants and vehicles.

The term "administration" and variants thereof (e.g., "administering" a compound) in reference to a compound of the invention each mean providing the compound or a prodrug of the compound to the individual in need of treatment. When a compound of the invention or prodrug thereof is provided in combination with one or more other active agents (e.g., AIDS antivirals), "administration" and its variants are each understood to include concurrent and sequential provision of the compound or prodrug thereof and other agents.

Thus, in accordance with the present invention there is further provided a method of treating and a pharmaceutical composition for treating HIV infection and AIDS. The treatment involves administering to a subject in need of such treatment a pharmaceutical composition comprising a pharmaceutical carrier and a therapeutically-effective amount of a compound of the present invention.

As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts.

By "pharmaceutically acceptable" it is meant the carrier, diluent or excipient must be compatible with the other ingredients of the formulation and not deleterious to the recipient thereof.

The term "subject," (alternatively referred to herein as "patient") as used herein refers to an animal, preferably a mammal, most preferably a human, who has been the object of treatment, observation or experiment.

The term "therapeutically effective amount" as used herein means
5 that amount of active compound or pharmaceutical agent that elicits the biological or medicinal response in a tissue, system, animal or human that is being sought by a researcher, veterinarian, medical doctor or other clinician, which includes alleviation of the symptoms of the disease being treated.

These pharmaceutical compositions may be in the form of orally-
10 administrable suspensions or tablets or capsules, nasal sprays, sterile injectible preparations, for example, as sterile injectible aqueous or oleagenous suspensions or suppositories.

When administered orally as a suspension, these compositions are prepared according to techniques well-known in the art of pharmaceutical formulation
15 and may contain microcrystalline cellulose for imparting bulk, alginic acid or sodium alginate as a suspending agent, methylcellulose as a viscosity enhancer, and sweeteners/flavoring agents known in the art. As immediate release tablets, these compositions may contain microcrystalline cellulose, dicalcium phosphate, starch, magnesium stearate and lactose and/or other excipients, binders, extenders,
20 disintegrants, diluents and lubricants known in the art.

When administered by nasal aerosol or inhalation, these compositions are prepared according to techniques well-known in the art of pharmaceutical formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability,
25 fluorocarbons, and/or other solubilizing or dispersing agents known in the art.

The injectible solutions or suspensions may be formulated according to known art, using suitable non-toxic, parenterally-acceptable diluents or solvents, such as mannitol, 1,3-butanediol, water, Ringer's solution or isotonic sodium chloride solution, or suitable dispersing or wetting and suspending agents, such as sterile,
30 bland, fixed oils, including synthetic mono- or diglycerides, and fatty acids, including oleic acid.

When rectally administered in the form of suppositories, these compositions may be prepared by mixing the drug with a suitable non-irritating excipient, such as cocoa butter, synthetic glyceride esters of polyethylene glycols,

which are solid at ordinary temperatures, but liquefy and/or dissolve in the rectal cavity to release the drug.

The compounds of this invention can be administered orally to humans in a dosage range of 0.1 to 1000 mg/kg body weight in divided doses. One preferred dosage range is 0.1 to 200 mg/kg body weight orally in divided doses. Another preferred dosage range is 0.5 to 100 mg/kg body weight orally in divided doses. For oral administration, the compositions are preferably provided in the form of tablets containing 1.0 to 1000 milligrams of the active ingredient, particularly 1.0, 5.0, 10.0, 15.0, 20.0, 25.0, 50.0, 75.0, 100.0, 150.0, 200.0, 250.0, 300.0, 400.0, 500.0, 600.0, 750.0, 800.0, 900.0, and 1000.0 milligrams of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated. It will be understood, however, that the specific dose level and frequency of dosage for any particular patient may be varied and will depend upon a variety of factors including the activity of the specific compound employed, the metabolic stability and length of action of that compound, the age, body weight, general health, sex, diet, mode and time of administration, rate of excretion, drug combination, the severity of the particular condition, and the host undergoing therapy.

The present invention is also directed to combinations of the HIV integrase inhibitor compounds with one or more agents useful in the treatment of AIDS. For example, the compounds of this invention may be effectively administered, whether at periods of pre-exposure and/or post-exposure, in combination with effective amounts of the AIDS antivirals, immunomodulators, antiinfectives, or vaccines, such as those in the following table.

It will be understood that the scope of combinations of the compounds of this invention with AIDS antivirals, immunomodulators, anti-infectives or vaccines is not limited to the list in the above Table, but includes in principle any combination with any pharmaceutical composition useful for the treatment of AIDS.

Preferred combinations are simultaneous or sequential treatments of a compound of the present invention and an inhibitor of HIV protease and/or a non-nucleoside inhibitor of HIV reverse transcriptase. An optional fourth component in the combination is a nucleoside inhibitor of HIV reverse transcriptase, such as AZT, 3TC, ddC or ddI. A preferred inhibitor of HIV protease is the sulfate salt of indinavir, which is N-(2(R)-hydroxy-1(S)-indanyl)-2(R)-phenylmethyl-4-(S)-hydroxy-5-(1-(4-(3-pyridyl-methyl)-2(S)-N'-(t-butylcarboxamido)-piperazinyl))-pentaneamide ethanolate, and is synthesized according to US 5413999. Indinavir is generally administered at a dosage of 800 mg three times a day. Other preferred protease inhibitors are nelfinavir and ritonavir. Another preferred inhibitor of HIV protease is saquinavir which is administered in a dosage of 600 or 1200 mg tid. Still another preferred protease inhibitor is Compound A, which is N-(2(R)-hydroxy-1(S)-indanyl)-

2(R)-phenylmethyl-4(S)-hydroxy-5-(1-(4-(2-benzo[b]furanylmethyl)-2(S)-N'-(t-butylcarboxamido)piperazinyl))pentanamide, preferably administered as the sulfate salt. Compound A can be prepared as described in US 5646148. Preferred non-nucleoside inhibitors of HIV reverse transcriptase include efavirenz. The preparation of ddC, ddI and AZT are also described in EPO 0,484,071. These combinations may have unexpected effects on limiting the spread and degree of infection of HIV. Preferred combinations include a compound of the present invention with the following (1) indinavir with efavirenz, and, optionally, AZT and/or 3TC and/or ddI and/or ddC; (2) indinavir, and any of AZT and/or ddI and/or ddC and/or 3TC, in particular, indinavir and AZT and 3TC; (3) stavudine and 3TC and/or zidovudine; (4) zidovudine and lamivudine and 141W94 and 1592U89; (5) zidovudine and lamivudine.

Another preferred combination is a compound of the present invention with indinavir and Compound A and optionally with one or more of efavirenz, AZT, 3TC, ddI and ddC. 15

To a cold (-78 C) solution of 1-benzyl-3,5-dibromobenzene (**3B**) (1.5 g) in diethyl ether (30 mL), a solution of n-BuLi in hexanes (2.5 M, 2.2 mL) was added. The resultant mixture was stirred at -78 C for 1 h and was treated with a solution of N-methoxy-N-methyl-5-methylpyrazine-2-carboxamide (1.0 g) in diethyl ether (3 mL). The reaction mixture was allowed to warm up slowly to room

A thick walled glass pressure vessel was charged 6-benzyl-8-bromo-4H-benzo[1,4]oxazin-3-one (0.64 g, 2.0 mmol), thallium acetate (0.58 g, 2.2 mmol),
5 1,3-bis(diphenylphosphino)-propane (206 mg, 0.5 mmol), palladium acetate (112 mg, 0.5 mmol), and dry N,N-dimethylformamide (4 mL). The slurry was purged for 15 minutes with argon and then treated with triethylamine (0.82 mL, 6.0 mmol), and n-butyl vinyl ether (1.0 mL, 7.7 mmol). The pressure vessel was sealed and heated in a 100 °C oil bath with magnetic stirring overnight. The dark reaction mixture was
10 allowed to cool to ambient temperature and filtered through celite. The filtrate was concentrated in vacuo and the residue diluted with THF (20 mL), treated with 1M aqueous HCl (6 mL), and stirred for 1 hour. The mixture was diluted with water and extracted with ethyl acetate (3 times). The combined extracts were washed with brine, dried (MgSO₄), filtered, and concentrated in vacuo to a brown gum.
15 Purification by column chromatography on silica gel with a 30%-40% ethyl acetate in hexane gradient afforded the title compound as a white solid.

1-[6-Benzyl-3-oxo-3,4-dihydro-2H-benzo[1,4]oxazin-8-yl]-3-(4-methylpyridin-2-yl)propane-1,3-dione (15E)

To a solution of 8-acetyl-6-benzyl-4H-benzo[1,4]oxazin-3-one (150 mg, 0.5 mmol) in dry THF (5 mL) under an atmosphere of argon, was added 4-methylpyridine-2-carboxylic acid methyl ester (3H) (120 mg, 0.79 mmol) and sodium ethoxide (122 mg, 1.8 mmol) in single portions. The mixture was stirred 4 hours at
25 ambient temperature, diluted with water and acidified to pH ~2 with 1M aqueous HCl. The mixture was extracted with ethyl acetate (3 times), the combined extracts washed with brine, dried (MgSO₄), filtered, and concentrated in vacuo to a pale
30 yellow solid. Recrystallization from CHCl₃ / hexane afforded the title compound as a beige solid.

1-(3-Benzyl-5-[1,2,4]triazol-1-ylmethylphenyl)-3-(4-methylpyridin-2-yl)-propane-1,3-dione (**16C**)

10

3-Benzyl-5-[1,2,4]triazol-1-ylmethyl-1-bromobenzene (16A)

A mixture of sodium hydride (132 mg, 60% dispersion in mineral oil, washed with hexane) and 1,2,4-triazole (228 mg) in DMF was stirred at room temperature for 10 min. The resultant mixture was treated with a solution of 3-benzyl-5-bromobenzyl bromide in DMF. The reaction mixture was stirred at room temperature over night. The product mixture was concentrated under vacuum and the residue partitioned between ethyl acetate and aqueous ammonium chloride. The organic extract was washed with brine, dried over magnesium sulfate, filtered, and concentrated under vacuum. The crude triazole product was used for next step without further purification.

2-(3-Benzyl-5-bromo-phenyl)-pyrazine (25A)

20

Step 1: (3,5-Dibromo-phenyl)-phenyl-methanol (25a1)

To a solution of 1,3,5-tribromobenzene (10 g, 0.0318 mole) in ether (500g), under argon was added nBuLi in hexanes (13.4 mL, 0.0318 mole) dropwise at -78°C. During the initial cooling of the tribromobenzene in ether some solids crashed

25 out of solution. After addition of nBuLi was complete the reaction was allowed to stir

for 0.5 hours at which time neat benzaldehyde (3.55 mL, 0.035 mole) was added dropwise to the vigorously stirred reaction mixture. Once addition was complete the reaction was allowed to reach 0°C and 100 mL of HCl was added to the mixture. This was extracted with ether two times, dried with brine and over sodium sulfate and concentrated to give an oil. The crude product was purified by chromatography with 5% EtOAc/Hexanes to afford **25a1** as a colorless oil that solidified on the bench. Rf = 0.44 (5%EtOAc/Hexanes) 1H NMR (400MHz, CDCl3) δ 7.56-7.55 (m, 1H), 7.48-7.47 (m, 2H), 7.39-7.29 (m, 5H), 5.75 (d, 1H, $j=3.48$ Hz), 2.28-2.27 (d, 1H, $j=3.48$ Hz).

Step 2: 3-Bromo-5-benzyl-bromobenzene (**25a2**)

A solution of **25a1** (2.0 g, 0.00548 mole) and triethylsilane (1.39 mL, 0.00877 mole) in methylene chloride (20 mL) was chilled to 0°C under argon with stirring followed by addition of boron trifluoride etherate (1.10 mL, 0.00877 mole).

The reaction was stirred at room temperature overnight. The reaction mixture was poured into 75 mL of saturated sodium bicarbonate and extracted with methylene chloride two times. The combined organic layers were dried over sodium sulfate, filtered and the solvent removed. Chromatographic purification using 1% EtOAc/Hexanes afforded **25a2**. Step 3: 2-(3-Benzyl-5-bromo-phenyl)-pyrazine (**25A**)

To a solution of **25a2** (1 g, 0.00307 mole) in THF (20 mL) under argon at -78°C was added 2.4M nBuLi in hexanes (1.4 mL, 0.00337 mole) dropwise. After 45 minutes of stirring, the solution was treated with 0.5M ZnCl2 in THF (6.14 mL 0.00337 mole) and this was warmed to 0°C. To the reaction was added a cold mixture of chloropyrazine (0.35 mL, 0.00307 mole) and tetrakis(triphenylphosphine) palladium (18 mg, 0.0000154 mole) in THF (5 mL) and the reaction was heated to reflux for two hours. The reaction was then cooled, concentrated and treated with EtOAc and washed with 6% aqueous solution of diaminotetraacetic acid disodium salt dihydrate two times. The EtOAc layer was dried over sodium sulfate, filtered and concentrated. Chromatographic purification with 15% EtOAc/hexanes afforded a clear oil **25A**. Determination of Log P

The procedure for determining partition coefficient P at ambient

Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

Please See Extra Sheet.

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☒ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
1-6, 11-14, 17-30 (in part) and 7-10
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☒ No protest accompanied the payment of additional search fees.

BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING

This ISA found multiple inventions as follows:

This application contains the following inventions or groups of inventions which are not so linked as to form a single inventive concept under PCT Rule 13.1. In order for all inventions to be searched, the appropriate additional search fees must be paid.

Group I, claim(s) 1-6 (in part), 7-10, 17 (in part), 18 and 19-30 (in part), drawn to compounds wherein ring B is a pyridyl, corresponding composition and method of use.

Group II, claim(s) 1-6, 11-12, 17, 19-21 and 23-30 (all in part), drawn to compounds wherein ring B is pyrazinyl, corresponding composition and method of use.

Group III, claim(s) 1-6, 11, 13, 17 and 19-30 (all in part), drawn to compounds wherein ring B is pyrimidinyl, corresponding composition and method of use.

Group IV, claim(s) 1-6, 11-14, 17 and 19-30 (all in part), drawn to compounds wherein ring B is imidazolyl, corresponding composition and method of use.

Group V, claim(s) 1-6, 11-12, 17, and 19-30 (all in part), drawn to compounds wherein ring B is triazolyl, corresponding composition and method of use.

Group VI, claim(s) 1-6, 11, 17, 19-21 and 23-30 (all in part), drawn to compounds wherein ring B is tetrazolyl, corresponding composition and method of use.

Group VII, claim(s) 1-6, 11-14, 17, and 19-30 (all in part), drawn to compounds wherein ring B is thiazolyl, corresponding composition and method of use.

Group VIII, claim(s) 1-3, 15, 17, 19-21 and 23-30 (all in part), drawn to compounds wherein ring B is quinoxaliny, corresponding composition and method of use.

Group IX, claim(s) 1-3, 15, 17, 19-21 and 23-30 (all in part), drawn to compounds wherein ring B is isoquinoliny, corresponding composition and method of use.

Group X, claim(s) 1-3 (in part), 15 (in part), 16, 17 (in part), 19-21 (in part) and 23-30 (in part), drawn to compounds wherein ring B is naphthyridinyl, corresponding composition and method of use.

Group XI, claim(s) 1-5, 17, 19-20 and 23-30 (all in part), drawn to compounds wherein ring B is a heterocyclic group other than those defined for groups I-X above, corresponding composition and method of use.

The inventions listed as Groups I-XI do not relate to a single inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons: The variable core created by various definitions of B in the compounds do not belong to a recognized class of chemical compounds in the art.
